**It is not clearly stated whether the mixture is 96.8 mass % or 96.8 volume % ethanol.**

**Solubilities reported as grams of hexahydrate in 100 g of solvent.**

**Molalities calculated by the compilers.**

AUXILIARY INFORMATION

METHOD/APPARATUS/PROCEDURE:
Isothermal method used. Equilibrium was reached after 3-4 h. Identical results obtained by approaching equilibrium from above and below. Two of the data points in the table obtained after 3 hours of equilibration, and the remaining two data points obtained after 4 h of equilibration.

The metal content in each aliquot taken for analysis was determined by complexometric titration with Trilon B.

Analyses of the solids withdrawn at 20°C, 40°C and 60°C showed the solid phase to be the hexahydrate: i.e. ethanol was not found in any of the solid phases.

SOURCE AND PURITY OF MATERIALS:
TbCl₃·6H₂O prepd by dissolving c.p. grade oxide in dil (1:3) HCl followed by evapn and crystn. The crystals were dried in a desiccator over CaCl₂, P₂O₅ and NaOH. The crystals analyzed for the metal by titrn with Trilon B, and for Cl by the Volhard method. The hexahydrate melted at 158.0 - 158.8°C. 96.8% ethanol prepd by prolonged boiling of c.p. grade 93.5% ethanol with anhydr CuSO₄ followed by distn. Ethanol concn detd refractometrically and pycnometrically.

ESTIMATED ERROR:
Soly: results apparently precise to within ± 0.9 % ( compilers).
Temp: nothing specified.

**AUXILIARY INFORMATION**

**METHOD/APPARATUS/PROCEDURE:**

Experimental details not given, but were probably similar to previous works of the author which are compiled throughout this volume.

**SOURCE AND PURITY OF MATERIALS:**

Nothing specified, but based on previous work by the authors the anhydrous salt was probably prepared by the method of Taylor and Carter (1).

**ESTIMATED ERROR:**

Nothing specified.

**REFERENCES:**

1. Taylor, M.D.; Carter, C.P.
**COMPONENTS:**

1. Terbium chloride; TbCl₃; [10042-88-3]
2. 1,2-Diethoxyethane; C₆H₁₄O₂; [629-14-1]

**ORIGINAL MEASUREMENTS:**
Kirmse, E.M.; Zwentasch, K.J.

**VARIABLES:**
T/K = 298

**PREPARED BY:**
T. Mioduski

**EXPERIMENTAL VALUES:**

The solubility of TbCl₃ in 1,2-diethoxyethane at 25°C was reported to be

0.22 mass %

The corresponding molality calculated by the compiler is

0.0083 mol kg⁻¹

The composition of the solid phase was given in terms of the Tb:Cl:ether ratio as

1:2.93:1.37

**AUXILIARY INFORMATION**

**METHOD/APPARATUS/PROCEDURE:**
Isothermal method used. The anhydrous mixtures were equilibrated at 25°C for several days with frequent shaking.

The solid phase was dried in a vacuum desiccator over P₂O₅.

Tb was determined by complexometric titration using Xylenol Orange indicator. Chloride was determined by the Volhard titration method.

**SOURCE AND PURITY OF MATERIALS:**
Sources and purities of materials not given. The anhydrous chloride was obtained by the method of Taylor and Carter (1).

The solvent was prepared by the Williamson synthesis: i.e. by reaction of C₂H₅I with the monoethylether of ethylene glycol.

**ESTIMATED ERROR:**
No estimates possible.

The solid phase is \( \text{TbCl}_3 \)

AUXILIARY INFORMATION

METHOD/APPARATUS/PROCEDURE:
Saturated solutions prepared isothermally with magnetic stirring. Equilibrium was attained after 25-30 d. The solution was centrifuged and an aliquot for analysis taken and added to methanol and precipitated with aq \( \text{NH}_3 \). The pptd \( \text{Tb(OH)}_3 \) was washed repeatedly and heated to the oxide for gravimetric analysis. The solid phase was analyzed (no details given) for phosphorous, and only the anhydrous \( \text{TbCl}_3 \) was found.

All operations were performed in a dry box through which a stream of argon was passed.

The major objective of this work was to establish the nature of complexation between TBP and \( \text{TbCl}_3 \) in solution.

(3) Hexamethylphosphorotriamide; C₆H₁₈N₃O₃P; [680-31-9]

**ORIGINAL MEASUREMENTS:**

Mikheev, N.B.; Kamenskaya, A.N.; Konovalova, N.A.; Zhilina, T.A.

**VARIABLES:**

Room temperature: T/K = 298 ± 3

**PREPARED BY:**

T. Mioduski and M. Salomon

**EXPERIMENTAL VALUES:**

Starting with the solvate TbCl₃·3(CH₃)₂N₃PO, the solubility at 25 ± 3°C was given as

\[ 0.128 \text{ mol dm}^{-3} \]

Table 3 in the English translation of the source paper states the temperature to be 23 ± 3°C. This is probably a typographical error as the text clearly states that all measurements were carried out at 25 ± 3°C.

**AUXILIARY INFORMATION**

**METHOD/APPARATUS/PROCEDURE:**

Isothermal method. Salt and solvent were placed in a test-tube in a dry box, and the tube agitated at room temperature until equilibrium was reached. Aliquots were withdrawn periodically and analyzed for the metal content. Rare earth concentration was determined by complexometric titration, and by the radiometric method using the isotope Tm-170 (t = 169 d). Authors state that results for both methods agreed. Although not clearly stated, it appears that equilibrium was reached in several weeks to several months.

Solid phase samples washed three times with benzene or ether and dried on a steam bath in an argon atmosphere. The solid phase was analyzed and found to be TbCl₃·3C₆H₁₈N₃O₃P.

The solvate was analyzed for metal content by complexometric titration, for chloride by the Volhard method, and the solvent was obtained by difference. IR spectra confirmed the absence of water. Structural studies of the solvate were also carried out by X-ray analysis.

**SOURCE AND PURITY OF MATERIALS:**

TbCl₃·3C₆H₁₈N₃O₃P prepared by dissolving the hydrate in the solvent and heating to 140-145°C for 5 h. The solvate was pptd by addition of abs ether, washed 7 times with ether, and dried over P₂O₅ in a stream of dry nitrogen. Yield was about 90%.

The solvent was purified as described in (1).

**ESTIMATED ERROR:**

Soly: precision ± 0.007 mol dm⁻³ at a 95% level of confidence (authors).

Temp: precision ± 3K.

a Solutions preheated to 220°C. Values in parenthesis correspond to preheating at 120°C.

b This is also the solubility of TbCl₃ in the SnCl₄-POCl₃ mixture because the oxide is quantitatively converted to the chloride according to

\[ \text{Tb}_2O₃ + 6\text{POCl}_3 = 2\text{TbCl}_3 + 3\text{P}_2\text{O}_3\text{Cl}_4 \]

Authors state that the solubility of TbCl₃ is enhanced by complex formation according to

\[ 2\text{TbCl}_3 + 3\text{SnCl}_4 = \text{Tb}_2(\text{SnCl}_6)_3 \]

AUXILIARY INFORMATION

METHOD/APPARATUS/PROCEDURE:
Isothermal method used. POCl₃ + SnCl₄ solutions were prepared by volume in a dry box. The SnCl₄ content was verified by chemical analysis for Sn. This solution and Tb₂O₃ were placed in sealed ampoules, heated to 20-250°C to increase the rate of solution, and then rotated in an air thermostat at 20°C for 2-200 hours. Without preheating, equilibrium was established after 200 hours. Preheating to 220°C lowered the equilibrium time at 20°C to 2 hours.

Tb was determined by colorimetric analysis or the oxalate method. The reported solubilities are mean values based on 3-5 parallel determinations.

SOURCE AND PURITY OF MATERIALS:
Tb₄O₇ of "the first sort" was reduced to Tb₂O₃ with hydrogen at 950°C.
"Pure" grade SnCl₄ and POCl₃ were dehydrated with P₂O₅ and distilled under vacuum.

ESTIMATED ERROR:
Soly: authors state the "coefficient of variance" to be less than 7%.
Temp: precision presumably ± 0.2 K (compiler).
