

<p>COMPONENTS:</p> <p>(1) Propane; C₃H₈; [74-98-6] Butane; C₄H₁₀; [106-97-8] 2-Methylpropane; C₄H₁₀; [75-28-5]</p> <p>(2) Common solvents or aqueous solutions or suspensions of biological substances</p>	<p>EVALUATOR:</p> <p>Walter Hayduk Department of Chemical Engineering University of Ottawa Ottawa, Canada K1N 9B4</p> <p>November, 1984</p>
<p>CRITICAL EVALUATION:</p> <p>The solubilities of <i>propane</i>, <i>butane</i> and <i>2-methylpropane</i> in common solvents or aqueous solutions or suspensions of biological substances are all of qualitative value only. In no case is the composition of the solvent unequivocally specified so that the measurement can be reproduced elsewhere. Nonetheless, the data may be of value to those requiring such information. These data remain unclassified.</p> <p>The early solubility of <i>propane</i> in <u>turpentine</u> as reported by Lebeau¹ is expected to be too low as are some of the other data reported by this author. Nor can the composition of turpentine be explicitly defined because its composition is dependent on its source and process for its production. The solubilities of <i>propane</i> and <i>butane</i> are available in <u>kerosene A-3</u>, and in <u>gasoline solvents</u>²; these data are of low accuracy (10 - 15%) and are also for solvents that are essentially mixed solvents containing many components. The solubilities of all three gases are available in aqueous suspensions of one or more <u>egg phospholipid components</u>³. General comments that may be made are that the order of solubilities of the three gases is the same as that observed in most organic solvents rather than that in water and that the solubilities are many times those in water alone. Finally, data are available for solubilities of <i>butane</i> in aqueous solutions (5 mass %) of <u>human hemoglobin</u> and <u>bovine serum albumin</u>⁴. These latter data were read from a graph and are of low accuracy.</p> <p><u>References</u></p> <ol style="list-style-type: none"> 1. Lebeau, P. <i>Compt. AUXILIARY INFORMATION				
METHOD/APPARATUS/PROCEDURE:		SOURCE AND PURITY OF MATERIALS:		
The solubility was determined at pressures from 0.15 to 0.70 atm and extrapolated to a gas partial pressure of 1 atm using Henry's law. An all-glass apparatus was used which consisted of a calibrated liquid contactor, 10 cm ³ in volume and a 5-10 cm ³ gas storage tube. The solution was deaerated in the contactor under vacuum. The pressure was measured with a manometer. The initial and final gas pressures and volumes, together with the compressibilities were used to compute the molal solubilities. The quantity of solvent charged was determined by weight.		1. Phillips Petroleum, research grade. Purity not specified. 2a. Crystalline BSA from Pentex (Lot BX3) deionized on Dowex-1 and Dowex-50 ion exchangers. 2b. Human hemoglobin; no further details given. 3. Deaerated.
